Agricultural Equipment Statistics Committee

Product Definitions and Reporting Classification Methods

Updated – May 8, 2020

(All product definitions are for North America unless otherwise indicated)

FARM TRACTORS
A self-propelled wheeled or tracked machine, designed primarily to provide tractive power to pull, push, carry and/or provide power to implements designed primarily for agricultural usage. Agricultural tractors have 7.5 Kw (10hp) or more net engine horsepower per Society of Automotive Engineers Standard J1349, Engine Test Code-Spark Ignition and Diesel. (Source: ASAE Yearbook of Standards)

In addition, farm tractors have one or more of the following characteristics:

1. ASAE 3-point hitch with position control - category 1 or above

2. ASAE 540 rpm PTO, or larger, transmission (dual clutch or independent)

PTO horsepower is defined as maximum power obtained at the rated engine speed specified by the manufacturer with the governor control set for maximum power.

Two Wheel Drive Tractors (FE01) typically have larger tires mounted on the rear and smaller tires mounted on the front. Front wheel assist (FWA) tractors would typically incorporate larger front tires than two wheel drive tractors. Exceptions to this definition and included in the two wheel drive farm tractor data are the Challenger models and the New Holland bi-directional tractor, as approved by the AE/CFIEI/FEC Statistics Committee.

Reporting Classifications: by Advertised PTO horsepower
**A Four Wheel Drive Tractor (FE22)** is further defined as a large frame machine with equal size wheels with the capability to dual/triple all wheel; equal and consistent power to all wheels; full time power to all wheels; engages primarily in heavy draft and drawbar applications normally considered to be related to farming; all wheel steer; and articulated or rigid frame. Exceptions to this definition and included in the four-wheel drive farm tractor data are the Challenger models.

*Reporting Classifications: by Advertised Gross Engine horsepower*

**FE05 - Baler, Rectangular**
Self-propelled or pull-type machine that compresses previously cut dried materials in a square or rectangular shaped chamber by the use of a pitman and plunger head. Contains a self-feeding device, which is mechanically operated, and timed so that when the plunger is retracted, the feeder forces the dried materials into a baling chamber. The bale is then mechanically tied by some means (i.e., twine tie or wire tie).

*Reporting classifications: by measurement of the cross section of the bale or bale chamber in square feet (i.e., a 14” by 18” bale would be 1.75 square feet)*
**FE06 - Baler, Round**
Self-propelled or pull-type machine that rolls the material (i.e., hay, grass, straw, corn stalks, etc.) into bales in a continuous stream. Material is compressed into a large round bale by belts or chains or rollers. The bale is then tied by some means (i.e., twine tie or net). The machine opens and ejects the bale from the chamber. Entries into this program must produce a bale size larger than 35 cubic feet to be considered.

Formula to calculate is $\pi * \text{radius}^2 \times \text{width}$ or $3.14159 \times (\frac{\text{Max Bale Diameter}}{2})^2 \times \text{Bale Width}$. Step by step instructions:

1) Take max. bale diameter in inches & divide by 12
2) Take bale width in inches and divide by 12
   example: Vermeer 605 is 72” x 61”. Take 72/12=6, 61/12 =5.083333) Keep decimals.
   Now use $\pi * \text{radius}^2 \times \text{width}$ ($3.14159 \times (\frac{\text{Max Bale Diameter}}{2})^2 \times \text{Bale Width}$
3) Take $3.14159 \times (\text{answer in step 1 divided by 2})^2$ (which is x itself)
   example: (take max bale diameter first / 2) $6/2=3$. $3^2=9$ Now $3.14159 \times 9 = 28.27431$
4) Take answer in step 3 x answer in step 2 = Max Bale size in cubic feet
   Example: $28.27431 \times 5.083333 = 143.72773307523$ rounded to tenth is 143.7

**FE08 - Grinder/Mixer, Portable Combination**
Portable feed milling and mixing unit - PTO driven machine (mechanical or hydraulic drive), capable of milling grain and transferring it into a tank. Unit should include an unloading auger capable of unloading product into different levels of containers. This category includes grinder/mixers and roller mixers.

*Reporting Classifications: in bushels of tank capacity (this program currently suspended)*

**FE11 - Manure Spreader, Conveyor Type**
A manure spreading device which includes a rectangular box body or hopper with a conveying means which moves material rearward to rotating paddles which spreads material behind the unit. Conveyor type manure spreaders are designed for semi-solid to pen-packed material that can contain long bedding.
Reporting classifications: by struck level capacity of unit in cubic feet (*this program currently suspended*)

**FE12 - Manure Spreader, V Bottom**
A manure spreading device which includes a "V" shaped body or hopper with a conveying means, generally an auger(s), to move the material forward to an expeller for a wide spread pattern to the side of the spreader or rearward to an expeller which spreads material to the rear. "V" bottom spreaders are designed for semi-liquid to pen-packed material exclusive of pen manure with long bedding.

Reporting classifications: by capacity of unit in gallons (*this program currently suspended*)

**FE15 - Planter, Pull Type**
A Pull type planter is a serialized frame member that supports multiple row units, and is towed via a pivoting connection at a draw bar or 2-point hitch.

Reporting classifications: by number of rows and unit design. Twin row planters will be reported as one row unit for each unit twin row. For example, a 36-twin-row unit, planting 72 rows will be reported as 36 rows.

**FE16 - Planter, Mounted**
A Mounted planter is a serialized frame member that supports multiple row units, and must be rigidly mounted via a 3-point hitch. Twin row planters will be reported as one row unit for each unit twin row. For example, a 36-twin-row unit, planting 72 rows will be reported as 36 rows.

**FE17 - Planter, Unit**
A unit planter is a row unit mechanism that contains a ground engaging component and a seed singling device that can not be operated independently of a serialized planter
frame, be it pull type or mounted. This is inclusive of "splitter" type systems that can be added to serialized planter frames, since they too can not act independently.

Reporting classifications: by number of rows and unit design (this program currently suspended)

**FE18 and FE19 - Planter, Special Reports**

FE18 - "flash" report  
Retail sales for Pull-Type and Mounted Planters (FE15 & FE16).

FE19 - "flash" report  
The number of rows for Pull-Type, Mounted and Unit Planters (FE15, FE16 & FE17)

**FE23 - Combine, Self-Propelled**

Integral engine-powered machine designed to harvest a wide variety of field grain, rice, field beans or dry peas, oil seed and grass seed crops. These machines incorporate either a crop cutting or gathering device, a threshing method, and grain holding capability. This category does not include harvesters of certain root crops.

Reporting classifications: by ISO gross engine kilowatts at rated engine speed, excluding power bursts/bulges, fans, and alternators (ISO 14396)

**FE27 – Self-Propelled Shear Bar Harvester**

A machine commonly known as Self-Propelled Forage Harvester, which is designed to precisely chop crops using a stationary shear bar and rotating knife cylinder. The chopped crop is ejected by an impeller through a chute into a truck or trailer. The Self-Propelled Forage Harvester can be operated with different header attachments for different crops or applications. Most common attachments are corn heads, pickup heads and direct-cut heads. In some cases the machines may also be used with special heads for the harvest of renewable resources or biofuels like small trees and other crops.

Reporting Classifications: self-propelled models are reported as Gross Engine Horsepower. Pull-type models are based upon class of design.
**FE31 - Loader, Farm (front-end)**
An attachment for various farm tractor models to lift and load many different types of materials. The loader attachment can be powered by the tractor hydraulic system or an optional auxiliary hydraulic system. Various attachment options to handle different products can usually be interchanged with a normal loader bucket. The loader may be a quick-detach model or one that permanently attaches to a tractor. A loader that is designed to be an integral part of a tractor's primary use would not be included in this category because it wouldn't be considered an attachment to the primary power source.

*Reporting classifications: by PTO horsepower of tractor which loader attachment is designed to fit and Lift Capacity at maximum height at the pivot pin.*

**FE52 - Cornhead**
A gathering unit for self-propelled combines used to harvest standing rows of eared corn. These are usually interchangeable attachments having either fixed or adjustable row width capability.

*Reporting classifications: by number of rows*

**FE53 - Plows, Moldboard**
A primary tillage implement which cuts, partially or complete inverts a layer of soil to bury surface materials, and pulverizes the soil. The part of the plow that cuts the soil is called the bottom or base. The moldboard is the curved plate above the bottom which receives the slice of soil and inverts it. Moldboard plows are equipped with one or more bottoms of various cutting widths. Bottoms are commonly right-hand that turn all slices to the right. Two-way moldboard plows are equipped with right-hand and left-hand bottoms that are alternately used to turn all slices in the same direction as the plow is operated back and forth across the field.

*Reporting classifications: by design type (this program is currently suspended)*
**FE56 - Disk Harrow, Offset**
A primary or secondary tillage implement consisting of two gangs of concave disks in tandem. The gangs cut and throw soil in opposite directions.

*Reporting classifications: by working width in feet*

**FE60 - Mower Conditioner, Sicklebar**
A machine powered by an agricultural tractor with power take off (PTO), which cuts grass, hay, or forage crop by means of a series of a reciprocating cutterbar. Crop passes through horizontally placed conditioning rolls and the machine deposits the cut and conditioned crop in a swath or windrow on the ground behind the unit.

*Reporting classifications: by cutterbar width in feet*

**FEBA - Backhoe Attachment, Tractor**
Tractor backhoe attachments are backhoes that may be attached to the tractor's 3 pt. hitch or attached to the tractor by way of a subframe attaching system or some other attaching system.

*Reporting classifications: by digging depth (flat bottom) in feet.*
**FEBT - Bale Thrower, Field**
A machine that is attached to the end of the bale chamber on a rectangular baler that automatically delivers (ejects) the bale of hay.

*Reporting classifications: all sizes* *(this program currently suspended)*

**FECD – Compact Disc**
The Compact Disc is a primary or secondary tillage implement consisting of two parallel gangs of concave discs. Disc blades are mounted individually with compound angles to the direction of travel.

*Reporting Classifications: by width of cut in feet*

**FED1 - Mower, Drum and Disk**
A mower which employs a series of rotating blade carriers for cutting grass, hay or forage crops. Implements may be mounted or pull-type, driven by farm tractor PTO or hydraulic system.

*Reporting classifications: cutting width in feet end of disc to end of disc*

**FED3 - Disk Harrow, Tandem**
A primary or secondary tillage implement consisting of two or four gangs of concave
disks. Adjustment of gang angle controls cutting aggressiveness. Disk harrow hitches are either rear mounted or pull-type.

**Reporting classifications: by working width in feet**

**FEDX – Combine Draper Head-Flexible**
A crop gathering unit for combines with a flexible frame, designed to collect and transfer crop into the threshing area. Cut crop is conveyed to the feederhouse opening by draper-type belts.

**Reporting classifications: by cutting width of crop area in feet**

**FEDR – Combine Draper Head-Rigid**
A crop gathering unit for combines with rigid frame, designed to collect and transfer crop into the threshing area. Cut crop is conveyed to the feederhouse opening by draper-type belts.

**FEEV – Ag Equipment Value**
Report the total dollar value (i.e., price paid by dealers or distributors) of all sales of agricultural equipment (whole goods and attachments) sold in the U.S. and in
Canada. Do not include construction, utility, lawn and garden, consumer equipment or repair parts. **Agricultural products not reported to AEM should still be included in this report.**

Report the total dollar value of **agricultural equipment parts** shipped to dealers and company stores in the U.S. and Canada. Parts value is defined as the value of net sales. **OEM parts sales are excluded.** Competitive parts are available from more than one source. Non-competitive parts are available only from the original manufacturer.

Report U.S. sales in **U.S. dollars** and Canada sales in **Canadian dollars**.

**FEFA - Forage Blower (including combination type)**
A machine with a feeder or collecting mechanism using a high velocity fan/blower that will transfer crop ensilage into upright silos.

*Reporting classifications: all sizes (this program is currently suspended)*

**FEFB - Forage Box (power unloading)**
A wagon or truck mounted container used to collect/transport crop ensilage for storage or feeding. The container will also be equipped with a mechanical device for unloading.

*Reporting classifications: by length of box in feet (this program currently suspended)*

**FEFH - Forage Harvester, Flail**
A machine designed to use a rotary impact device to directly cut/chop standing or windrowed forage crops. The chopped crop particles are not precisely cut in length due to the random process of the rotary impact knives.

*Reporting classifications: all sizes (this program currently suspended)*

**FEFS - Flail Shredders**
A PTO driven attachment with several knives or blades that spin on a horizontal axis to shred crop residue. These attachments are used in crops such as corn, milo, rice, grasses, potatoes, vegetables, etc. This includes both end drive and center driven units. Unit is either mounted on or pulled by a tractor and is positioned directly behind a tractor.

*Reporting Classifications: by feet*

**FEFT - Forage Harvester Headers**
Detachable/interchangeable crop gathering header devices for specific types of forage crops, either to directly cut standing crop or to pick up previously cut crop. Headers for
this category should be for use with self-propelled forage harvesters. Pull-type forage headers should not be included.

Reporting Classifications: by design type

**FELL - Box Scraper (formerly Land Leveler/Smoother)**
An implement that is pulled behind the 3 point hitch system of an agricultural or industrial tractor. The primary use is to smoother out rough terrain or material in landscaping or construction. Different types of levelers/smoothers are used to level out roads and irrigated fields. The "box" design of a leveler/smoother has a main crossbeam which provides the strength and base support of the implement. The crossbeam usually has scarifier shanks attached to break up the soil followed by a cutting edge designed to cut or smooth out the surface. A hinged backfill blade is attached to the rear of the implement for additional smoothing of materials in the forward operations and when the unit is reversed and the blade stops for backfilling. Also known as a "land leveler/smoother".

Reporting classifications: all sizes

**FEM1 - Mower Conditioner, Rotary Side-Pull**
A machine powered by an agricultural tractor with power take off (PTO), which cuts grass, hay or forage crop by means of a series of rotating discs or cylinders, each holding multiple knives. Crop passes through horizontally positioned conditioning rolls, or through rotating flails and the machine deposits the cut and conditioned crop in a swath or windrow on the ground behind the unit. The unit is pulled by the tractor and positioned to operate on only one side of the tractor.

Reporting classifications: by cutting width in meters or feet & inches and then converted to meters
**FEM2 - Mower Conditioner, Rotary Mid-Pivot Front-Mounted or Multi Unit**
A machine powered by an agricultural tractor with power take off (PTO), which cuts grass, hay or forage crop by means of a series of rotating discs or cylinders, each holding multiple knives. Crop passes through horizontally positioned conditioning rolls, or through rotating flails and the machine deposits the cut and conditioned crop in a swath or windrow on the ground behind the unit. The unit is pulled by the tractor and has a mid-pivot device that allows it to operate on either side of the tractor.

*Reporting classifications: by cutting width in meters or feet & inches and then converted to meters.*

**FEM3 – Mounted Mower Conditioner**
A machine powered with power take off (PTO), that is mounted on an agricultural tractor or a self-propelled forage harvester chassis, which cuts grass, hay or forage crop by means of a series of rotating discs or cylinders, each holding multiple knives. Crop
passes through horizontally positioned conditioning rolls, or through rotating flails and the machine deposits the cut and conditioned crop in a swath or windrow on the ground behind the unit(s). Units can be positioned to operate on the front individually, to the rear individually, to the rear when used with a reverse-station tractor, or in combinations of the front and rear simultaneously. Individual units are carried by the front and/or rear three-point hitch of an agricultural tractor, attached to a purpose built-self-propelled unit designed expressly for this purpose or adapted to a self-propelled forage harvester chassis.

*Reporting classifications:* by cutting width in meters or feet & inches and then converted to meters

**FEMO - Mower, Sicklebar/Cutter**
An implement employing a reciprocating knife cutterbar used for mowing grass, hay or forage crops. Implement may be powered by tractor PTO or hydraulic system. Units may be mounted or pull-type.

*Reporting classifications: all sizes (this program is currently suspended)*

**FEPC - Combine Pickup Headers**
A device consisting of a frame, auger and tined apparatus which attaches to the front end of a threshing unit to pick up previously cut and windrowed material.

*Reporting classifications: all sizes*

**FEPH - Post Hole Digger**
An attachment powered by mechanical power take-off or hydraulic fluid to drill holes in earthen soil or rock.

*Reporting classification: all sizes*
**FEPR - Combine Platform, Rigid Frame**
A crop gathering unit for combines designed to collect and transfer crop into the threshing area while maintaining some fixed space between the bottom of the platform and the ground.

*Reporting classifications: by cutting width of crop area in feet*

![FEPR - Combine Platform, Rigid Frame](image1)

**FEPX - Combine Platform, Flexible Frame**
A crop gathering unit for combines designed to collect and transfer crop into the threshing area while following ground contour allowing for close gathering of a crop that has grain heads or seed pods close to the ground.

*Reporting classifications: by cutting width of crop area in feet*

![FEPX - Combine Platform, Flexible Frame](image2)

**FER1 – Rigid Rotary Cutter**
A single rigid deck construction rough-cut mower, employing horizontal rotating knives to cut or shred grass, brush or crop residue. The rigid rotary cutter may be hitch mounted or pull-type from tractor. Powered by tractor PTO, tractor hydraulics system or mounted engine.

*Reporting classifications: by size of cutting swath in inches.*

![FER1 – Rigid Rotary Cutter](image3)
**FER2 – Flexible Rotary Cutter**
A flexible, multi deck construction rough-cut mower, employing horizontal rotating knives to cut or shred grass, brush or crop residue. The flexible rotary cutter may be hitch mounted or pull-type from tractor. Powered by tractor PTO, tractor hydraulics system or mounted engine.

*Reporting classifications: by size of cutting swath in inches.*

**FER3 – Rigid Rearmount Mower**
A single rigid deck construction finishing mower, employing horizontal rotating multi blades implement used for fine or finish mowing in lawn, turf and grounds keeping applications. The rigid finishing mower may be hitch mounted or pull-type (not mid-mounted) from tractor. Powered by tractor PTO, tractor hydraulics system or mounted engine.

*Reporting classifications: by size of cutting swath in inches.*

**FER4 – Flexible Rearmount Mower**
A flexible, multi deck construction finishing mower, employing horizontal rotating multi blades implement used for fine or finish mowing in lawn, turf and grounds keeping applications. The flexible finish mower may be hitch mounted or pull-type from tractor. Powered by tractor PTO, tractor hydraulics system or mounted engine.

*Reporting classifications: by size of cutting swath in inches.*
**FER5 – Rotary Tillers**
A rear-mounted, PTO driven tractor attachment with a series of blades mounted on a power driven shaft, used to break up soil. Units can be gearbox or chain driven and are used for primary or secondary tillage.

*Reporting classifications: by working width in inches*

**FERM - Mower, Multi-Spindle Rotary Finishing (mid-mounted)**
A mower which employs multiple horizontal rotating blades for fine or finishing mowing in lawn, turf and grounds keeping applications. Implement is mid- or under-mounted. Mower is carried between the tractor or power unit's front and rear axles. Power may be supplied by tractor PTO or hydraulic system.

*Reporting classifications: by size of cutting swath in inches*

**FERO - Rotary Rakes**
Rotary Rake: A machine pulled by or mounted on an agricultural tractor, either ground drive, driven by the tractor PTO, or by the tractor hydraulics. Primarily used to move crop material from one location to another, generally in a windrow, turning the crop to facilitate the drying and to prepare the crop for final processing. Process consists of one
or multiple horizontally positioned rotors with multiple tine bars and tines that sweep cut crop, positioning it into a windrow.

*Reporting classifications: by number of rotors*

**FESB - Snow Blower (tractor mounted)**
A machine that may be attached to agricultural tractors (to the front or rear 3 point hitch of the tractor), or other types of self-propelled machines (power units), that is designed to move snow. Snow blowers may be powered by hydraulic motors or by tractor’s power-take-off shaft. Snow blowers can have one auger, or multiple augers stacked on top of another, that move snow to the center to a fan behind the auger that propels and directs snow, by way of a chute, to where it is to be deposited in an adjacent space or in a truck. Common widths for snow blowers are between 4 feet and 9 feet.

*Reporting classifications: all sizes*

**FESG – Sugar Cane Harvester, Self-Propelled** Integral engine-powered machine designed to harvest sugar cane. These machines incorporate a crop cutting device, a cleaning method, and grain delivery mechanism.

*Reporting classifications: by ISO gross engine horsepower at rated engine speed and by number of rows. Also identify tracked versus wheel and narrow versus wide spacing.*
**FESP - Sprayer, Power (high-clearance) (FESP)**

A self-propelled machine used primarily in the application of pre- and post emergent pesticides, herbicides, fungicides and fertilizers on row or solid seed crops. The chassis is designed with a minimum or 36 inch crop clearance to pass through crops without causing unacceptable damage. The chassis must be able to operate in liquid applications and can be used in dry/granular applications. For dry/granular application, the product is contained in one or more bins and may be applied accurately to the crop or ground using either a broadcast spinner spreader or pneumatic applicator equipped with booms and appropriately spaced distribution outlets. With liquid product, the solution is contained in one or more tanks and is sprayed accurately on the crop by delivering a solution through a manifold to appropriately spaced nozzles. The nozzles are at a right angle outward from both sides of the chassis, usually parallel to and set distance from the ground.

*Reporting classifications: all sizes*
**FEST – Strip Tillage**

Strip till machines are designed to till a specific strip of soil a few inches wide in the direction of travel. This strip can be any depth and width as long as each strip leaves an unworked strip of soil between the row unit. The purpose of a strip till machine is one pass tillage and possibly fertilizer application to prepare a seedbed for later planting. It is not full-width, or broadcast tillage where the entire acre of soil is prepared the same. It combines the benefits of no-till management between the strips and greater tillage following each row unit. These machines are not self-propelled.

*Reporting Classifications: Sized by Total Number of Rows*

---

**FETB - Blade, Tractor**

An implement that is either pushed or pulled behind the 3 point hitch system of an agricultural or industrial tractor. The primary use is to move material from one place to another or to smooth out rough terrain in landscaping or light industrial construction. The design is a basic blade or moldboard attached to a mounting frame. Blade can be angled to move material from one side to another. Rear blades have reverse adjustments allowing 180 degrees of rotation. Front blades contain a spring trip design to allow blade pivot to avoid damage when encountering obstructions.

*Reporting classifications: by front or rear mount*
**FETD – Tedders**
Tedder: A machine pulled by or mounted on an agricultural tractor, usually driven by the tractor PTO. It is primarily used to disperse a swath or windrow of damp material to facilitate faster drying prior to raking

*Reporting classifications: by working width in feet*

**FETR – Tedder/Rotary Rake Combos**
Combination Tedder/Rake: A machine that combines the features of a tedder and rotary rake into one unit (see FETD and FERO).

*Reporting classifications: all sizes *(this program is currently suspended)*

**FEW1 - Windrower/Swather Heads - Auger-Sicklebar (self-propelled)**
A detachable/interchangeable unit which, when attached to a self-propelled windrower power unit, cuts hay, forage or specialty crops by means of a reciprocating knife within a cutter bar and a pickup or bat reel. Cut crop is conveyed to the opening by augers. The header deposits the cut or conditioned crop in a swath or windrow on the ground behind the unit. Crop can pass through horizontally positioned conditioning rolls.
**FEW2 - Windrower/Swather Heads - Disk (self-propelled)**
A detachable/interchangeable unit which, when attached to a self-propelled windrower power unit, cuts hay, forage or specialty crops by means of a series of rotating disks, each holding multiple knives. Cut crop may or may not be conveyed to the opening by augers. The header deposits the cut or conditioned crop in a swath or windrow on the ground behind the unit. Crop can pass through horizontally positioned conditioning rolls.

**FEW3 - Windrower, Self-Propelled**
A self-propelled machine with a separate cutterbar or rotary/disk header attachment for windrowing, swathing or conditioning grain, hay, forage or specialty crops.

**FEW4 - Windrower, Pull-Type**
A machine pulled and powered by an agricultural tractor with power take off (PTO) which has a separate cutterbar header attachment for windrowing or swathing grain or other specialty crops.
FEWC - Windrower/Swather Heads - Draper Type (self-propelled) (formerly Canvas Type)
A detachable/interchangeable unit which, when attached to a self-propelled windrower power unit, cuts grain, hay, forage, or specialty crops by means of a cutting device. Cut crop is conveyed to the opening by a rubber-coated draper. Head deposits the cut crop in a swath or windrow on the ground behind the unit.

FEWG - Wagon Gears
A frame with wheels designed as a transport undercarriage for a variety of flat-bed wagons or grain/silage boxes.

FEWR - Rake, Finger Wheel
A machine pulled by or mounted on an agricultural tractor. This machine can be driven by the tractor PTO, by the tractor hydraulics or ground drive. It is primarily used to move cut crop material from one location to another location, generally into a windrow, turning the crop to facilitate drying of the material and to prepare the material for final processing. Process consists of a series (2,3,4,etc.) of wheels with finger tines encompassing the circumference of the wheel. The wheels are ground driven and run at an angle to the direction of travel so as to move crop material. These wheels are either mounted on a single toolbar creating a windrow to one side of the toolbar, or on two toolbars in a V-configuration to pull material into one windrow at the center of the rake.
PG01 – Receivers: Receivers provide position information to the guidance system using differential GPS corrections. Generally, three levels of accuracy are available: Submeter, decimeter, and RTK (centimeter/sub-inch). Some receivers are strictly for sub-meter accuracy.

PG02 – Steering Kits: Steering kits enable either assisted or automated steering of the vehicle. Steering kits that are either field installed or dealer installed are to be reported. Integrated steering installed at the factory during the assembly of the machine should not be included.

PG03 – Activation Upgrades: However, most receivers in the precision ag market are upgradeable for various levels of system accuracy. Often, activations (or sometimes called “unlock codes” or “passcodes”) are available to upgrade a receiver from one accuracy level to another.

PG04 – Displays: Display units provide the visual interface between the precision guidance software that controls the machine steering and the machine operator. While displays provide other capabilities, such as equipment control, field mapping, or yield monitoring, all displays reported must be precision guidance capable for agricultural machines. Display models that have both integrated display and receiver functionality or a built-in receiver should be reported as both a display unit and a receiver unit. Reporting classifications for displays will be determined by screen size measure diagonally in inches.
TPA3 - Air Delivery System: An air delivery system consists of one or more holding tanks for seed and fertilizer. Beneath the tanks are metering systems that drop the products into an air stream created by a fan mounted on the air seeder. The airflow carries the metered product through a distribution system to some form of ground engaging implement. This category should not include any ground engaging implements such as an air hoe drill or a tillage implement. If the sale being reported includes an air seeder and a light duty cultivator, then the sale should be broken down into the two categories affected.

*Reporting classifications: tank capacity in bushels*

---

TP10 Hydraulic Trip Air Hoe Drill: This is a seeding implement that has on-row depth control and packing. Openers are mounted on an opener assembly that have individual depth control by adjusting the relative position of the packer wheel to the opener. Air flow is being used to distribute seed to the opener. The individual opener assembly depth control is the main criteria differentiating a Hydraulic Trip Air Hoe Drill from a Standard Air Hoe Drill with depth controlled by the front castor wheels and the rear on-row packing wheels.

*Reporting classifications: based on working width in feet*

---

TP11 Standard Air Hoe Drill: This is a seeding implement that has on-row packing and openers that are mounted on a "c"-shank, edge-on shank or hoe shank. Air flow is being used to distribute seed to the opener. The depth control for the implement must be maintained by the front castor wheels and the rear on-row packing wheels. The depth control is the main criteria differentiating an air hoe drill from a tillage implement with mounted packer wheels. A tillage implement has wheels within the frame to control the depth of the openers. It is recommended that this category include seeding implements with either knife openers or sweeps.

*Reporting classifications: based on working width in feet*
**TP12 - Air Disc Drill-Integrated:** This seeding or banding implement utilizes a disc ground engaging system to create an opening in the soil for seed placement. The implement may use a single disc or a double disc to create the seed trench. Air flow is being used to distribute the seed to the disc opener. There must be a differentiation between a disc drill and a hoe drill that has coulters mounted in front of the shanks to cut through heavy crop residue. The main criteria for an air disc drill should be that the disc creates the opening for seed placement. The seed is carried in a tank system that is integrated and mounted to the frame of the implement such that it is not easily removed and used for other applications. The tank system does not have a separate serial number.

Reporting classification: Based on working width in feet

**TP13 - Air Disc Drill-External:** This seeding or banding implement utilizes a disc ground engaging system to create an opening in the soil for seed placement. The 24 implement may use a single disc or a double disc to create the seed trench. Air flow is being used to distribute the seed to the disc opener. There must be a differentiation between a disc drill and a hoe drill that has coulters mounted in front of the shanks to cut through heavy crop residue. The main criteria for an air disc drill should be that the disc creates the opening for seed placement. The seed is carried in a separate tow behind or tow between cart that is attached to the machine via a hitch mechanism. The cart has a separate and independent serial number which is counted in the TPA3 category.

Reporting classification: Based on working width in feet

**TPCC - Plow, Combination Chisel**
Combination implements consist of chisel plows with gangs of flat or concave disks or individual rolling coulters preceding the shanks to cut surface residue and vegetation. Chisel plows differ from cultivators by being constructed stronger with wider spaced shanks for primary tillage.
**TPCF - Cultivator, Field**

A secondary tillage implement for seeded preparation, weed eradication, or fallow cultivation subsequent to some form of primary tillage. Field cultivators are equipped with spring steel shanks or teeth which have an integral forged point of mounted holes for replaceable shovel or sweep tools. Teeth are generally spaced 15-23 cm (6-9 in.) in staggered pattern. Frame sections are folded upwards or backwards for transport.

**TPCP - Plow, Chisel**

A primary or secondary tillage implement which shatters the soil without complete burial or mixing of surface materials. Multiple rows of staggered curved shanks are mounted either rigidly, with spring-cushions, or with spring resets. Interchangeable sweep, chisel, spike, or shovel tools are attached to each shank. Working width is increased by adding folding wings to the main unit. Not "V" type or subsoilers. Chisel plows differ from cultivators by being constructed stronger with wider spaced shanks for primary tillage.

**TPCR - Cultivator, Row Crop**

A secondary tillage implement for tilling between crop rows. The frame and cultivating tools are designed to adequately pass through standing crop rows without crop damage. Gangs of shanks are often independently suspended on parallel linkages with depth-controlling wheels to provide flotation with the soil surface. Tool options are shanks with shovels or sweeps, spring tee, and ground-driven rotary finger wheels.
Reporting classifications: by number of rows *(this program is currently suspended)*

**TPFM – Cultivator, Field (mounted)**
A 3 pt mounted secondary tillage implement for seedbed preparation, weed eradication, or fallow cultivation subsequent to some form of primary tillage. Field cultivators are equipped with spring steel shanks or teeth which have an integral forged point of mounted holes for replaceable shovel or sweep tools. Teeth are generally spaced up to 23 cm (9 in.) in staggered pattern.

Reporting classifications: by design type

**TPFP – Cultivator, Field (pull-type)**
A pull-type secondary tillage implement for seedbed preparation, weed eradication, or fallow cultivation subsequent to some form of primary tillage. Field cultivators are equipped with spring steel shanks or teeth which have an integral forged point of mounted holes for replaceable shovel or seep tools. Teeth are generally spaced up to 23 cm (9 in.) in staggered pattern. Frame sections are folded updates are backwards for transport.

Reporting classifications: by working width in feet

**TPGD - Grain Drill**
A family of drawn implements which plant or seed coarse grains, feed grains, legumes, oil crops, grasses and other field crops in rows generally narrower than 15” spacing. Different than planters, seed metering is accomplished by volumetric rather than singulation seed metering devices. Grain drills may also be equipped with ancillary boxes to meter and apply fertilizer and other granular materials at the time of seeding.

Reporting classifications: by design type *(includes the following)*:

Mounted Grain Drill: A grain drill which is mounted directly to the tractor 3-point hitch. Generally, the mounted grain drill is operated and transported while directly connected to the tractor 3-point hitch.
Press Grain Drill: A pull-type grain drill usually operated in multiple end-to-end sections. Using either hoe, shank, or double disk row units, press drills utilize ganged presswheels for flotation, depth gauging and seed row refirming. Press drills are usually transported by an end tow hitch and transport system.

Endwheel Grain Drill: A pull-type grain drill with transport wheels on the end of the drill.

No-Till Grain Drill: A grain drill, either 3-point mounted or pull-type, which plants or seeds directly into previous crop residue without tillage. Different than grain drills operating in tilled seedbeds, no-till grain drills utilize separate residue and soil cutting coulters or heavier row units with residue and soil cutting capabilities. Seeding is accomplished with minimum soil residue disturbance.

**TPGF - Grain Drill, Folding**
A grain drill (see grain drill definition) with two, three or more sections, which folds by hydraulic or mechanical means to a narrower transport width. Folding generally occurs in a horizontal plane and folds either forward or rearward.

*Reporting classifications: by number of sections*
**Packer**
A secondary tillage implement for crushing soil clods and compacting the soil. Packers consist of one or two in-line gangs of rollers. Roller sections may be legged wheels or any one of various shaped ridged wheels.

*Reporting classifications: (this program is currently suspended)*

**TPHM - Roller Harrow-Pulvi Mulcher**
A secondary tillage implement for seedbed preparation which crushes soil clods and smoothes and firms the soil surface. It consists of an in-line gang of ridged rollers, followed by one or more rows of staggered spring cultivator teeth, followed by a second in-line gang of ridged rollers.

*Reporting classifications: by working width in feet (this program is currently suspended)*

**TPMP - Tillage, Minimum Primary**
A primary tillage implement which shatters the soil without burial or mixing of surface materials. A machine utilizing one or more rows of shanks which mount on an "in-line" or "v-shaped" frame. This implement has a working depth of twelve inches or more below the soil surface. The design of this implement is to leave a percentage of crop residue on the soil surface to meet current federal minimum-tillage guidelines.

*Reporting classifications: by working width in feet*

**TPSC - Soil Conditioners**
The "Soil Conditioner" conditions the soil by breaking clods primarily with a rotary reel action which also results in moderate soil firming to improve seed-to-soil contact prior to planting. The reel is an open-design of spiral rods or blades that allows for soil movement through it. They have an operating weight of approximately 100 to 200 lb/ft and generally do not crush clods like soil packers with solid cast iron packer wheels. Soil Conditioners are frequently towed behind another implement in normal operation.
**TPTP - Tillage, Combination Primary**
A machine utilizing two (2) or more dissimilar tillage elements as integral parts of the base machine that displaces and shatters soil to reduce soil strength, and to bury or mix plant materials and fertilizers in the tilled layer. Primary tillage is more aggressive, deeper, and leaves a rougher surface relative to secondary tillage.

*Reporting classifications: by working width in feet*

---

**TPTS - Tillage, Combination Secondary**
A machine utilizing two (2) or more dissimilar tillage elements as integral parts of the base machine (not as attachments) that is used for seedbed preparation and/or chemical incorporation and that works the soil to a shallower depth than primary tillage, provides additional pulverization, levels and firms the soil, closes air pockets, and kills weeds. Seedbed preparations are the final secondary tillage operation.

*Reporting classifications: by working width in feet*

---

**TPVT – Tillage, Vertical**
Vertical tillage equipment consisting of two or more rows of blades (parallel or non-parallel rows, individual or gang mounted, straight coulters or shallow concavity blades), but with no compound blade angles to the direction of travel. Such equipment would not include horizontal tools such as sweeps or plow shares of any kind. This equipment (0-4” operating depth) is designed for seedbed preparation and near surface management of crop conditions in an effort to improve soil aeration, soil structure, aggregation, or tilth, and to enhance water infiltration residue sizing and decomposition, or to suppress weed growth.

*Reporting classifications: by working width in feet*
