From the AEM Safety Manual, mobile cranes are put into 3 categories:

**Lattice Boom**
A mobile crane is a self-propelled machine fitted with either wheels, tracks or is mounted onto a truck for use on different types of terrain. These different types of cranes typically have either a lattice boom or a telescopic hydraulic boom.

**Telescopic Hydraulic Boom**
When used normally, the mobile crane is an effective means of lifting heavy loads to varying heights. Mobile cranes can be used for a wide variety of material handling, including pick and carry operations. All safety precautions must be taken when performing any operation with a mobile crane.

**Truck Mounted**
